Rebooting Your TalkSwitch

A TalkSwitch system is a computer, just like the one on your desk. As with any computer, it requires a periodic reboot to continue working at maximum efficiency. We recommend that you routinely reboot your TalkSwitch every 1-2 weeks.

To reboot, click on the *Tools* menu in the management program, and select the reboot option. When you make this selection, you will see the reboot screen, which will give you the following options:

1. Reboot now (which will disconnect any calls in progress, so use with caution)
2. Lock down and reboot when current calls are completed (this allows current calls to continue, but does not allow any new ones to begin)
3. Reboot after idle for nnn minutes
4. Reboot at specified time

We recommend using the last option, as it can allow you to set your system to automatically reboot during your off hours.
